

COVID-19 management flow chart

15 April 2020 | version 2.0

1. COVID-19 management flow chart

Preparation for COVID-19

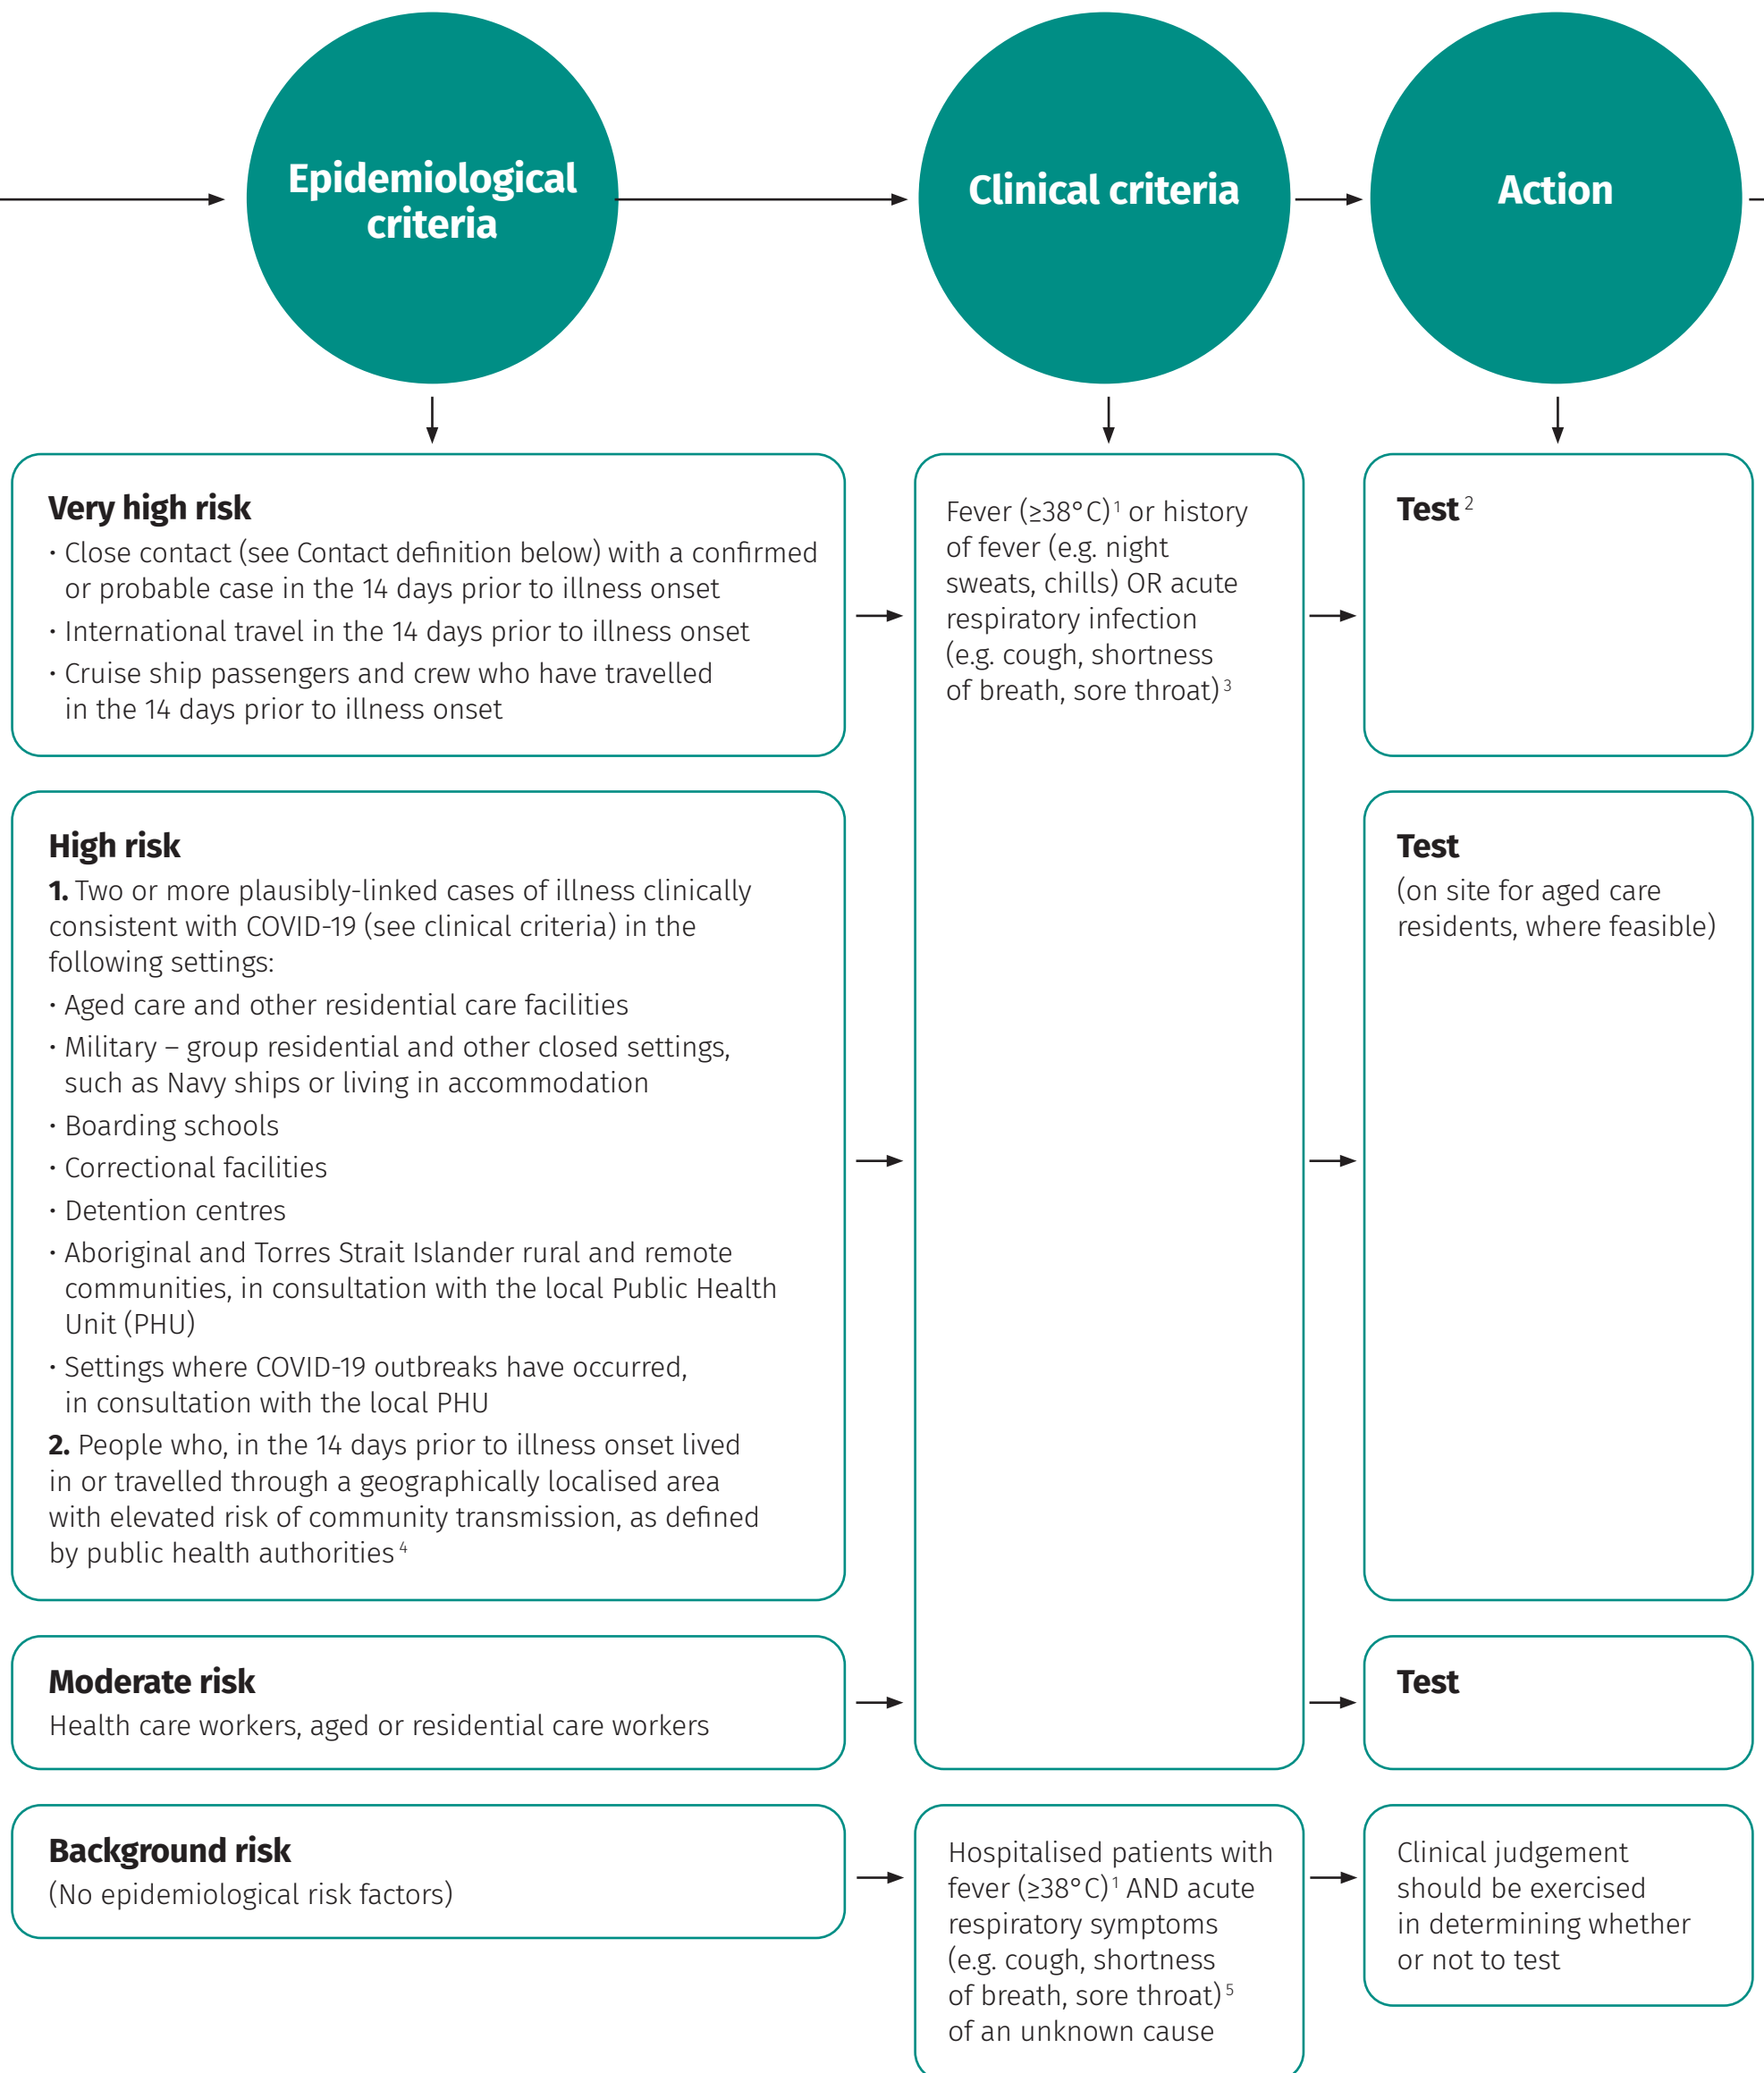

This information is current at the date specified. Guidance may change, and the most recent information is available from: [health.gov.au/resources/publications/coronavirus-covid-19-guidelines-for-outbreaks-in-residential-care-facilities](https://www.health.gov.au/resources/publications/coronavirus-covid-19-guidelines-for-outbreaks-in-residential-care-facilities)

Source: CDNA National Guidelines for the Prevention, Control and Public Health Management of COVID-19 Outbreaks in Residential Care Facilities in Australia.

2. COVID-19 management flow chart

Risk assessment for COVID-19

1 It is recommended that temperature is measured using a tympanic, oral or other thermometer proven to consistently and accurately represent core body temperature.

2 Testing household contacts of confirmed or probable cases of COVID-19 may not be indicated where resources are constrained. These cases would be considered 'probable cases' (see definition above).

3 In certain high risk outbreak settings, public health units may consider testing asymptomatic contacts to inform management of the outbreak.

4 For further information on geographically localised areas with elevated risk of community transmission, see: <https://www1.health.gov.au/internet/main/publishing.nsf/Content/cdna-song-novel-coronavirus.htm>

5 Clinical judgement should be exercised in testing hospitalised patients. All patients should attend an emergency department if clinical deterioration occurs.

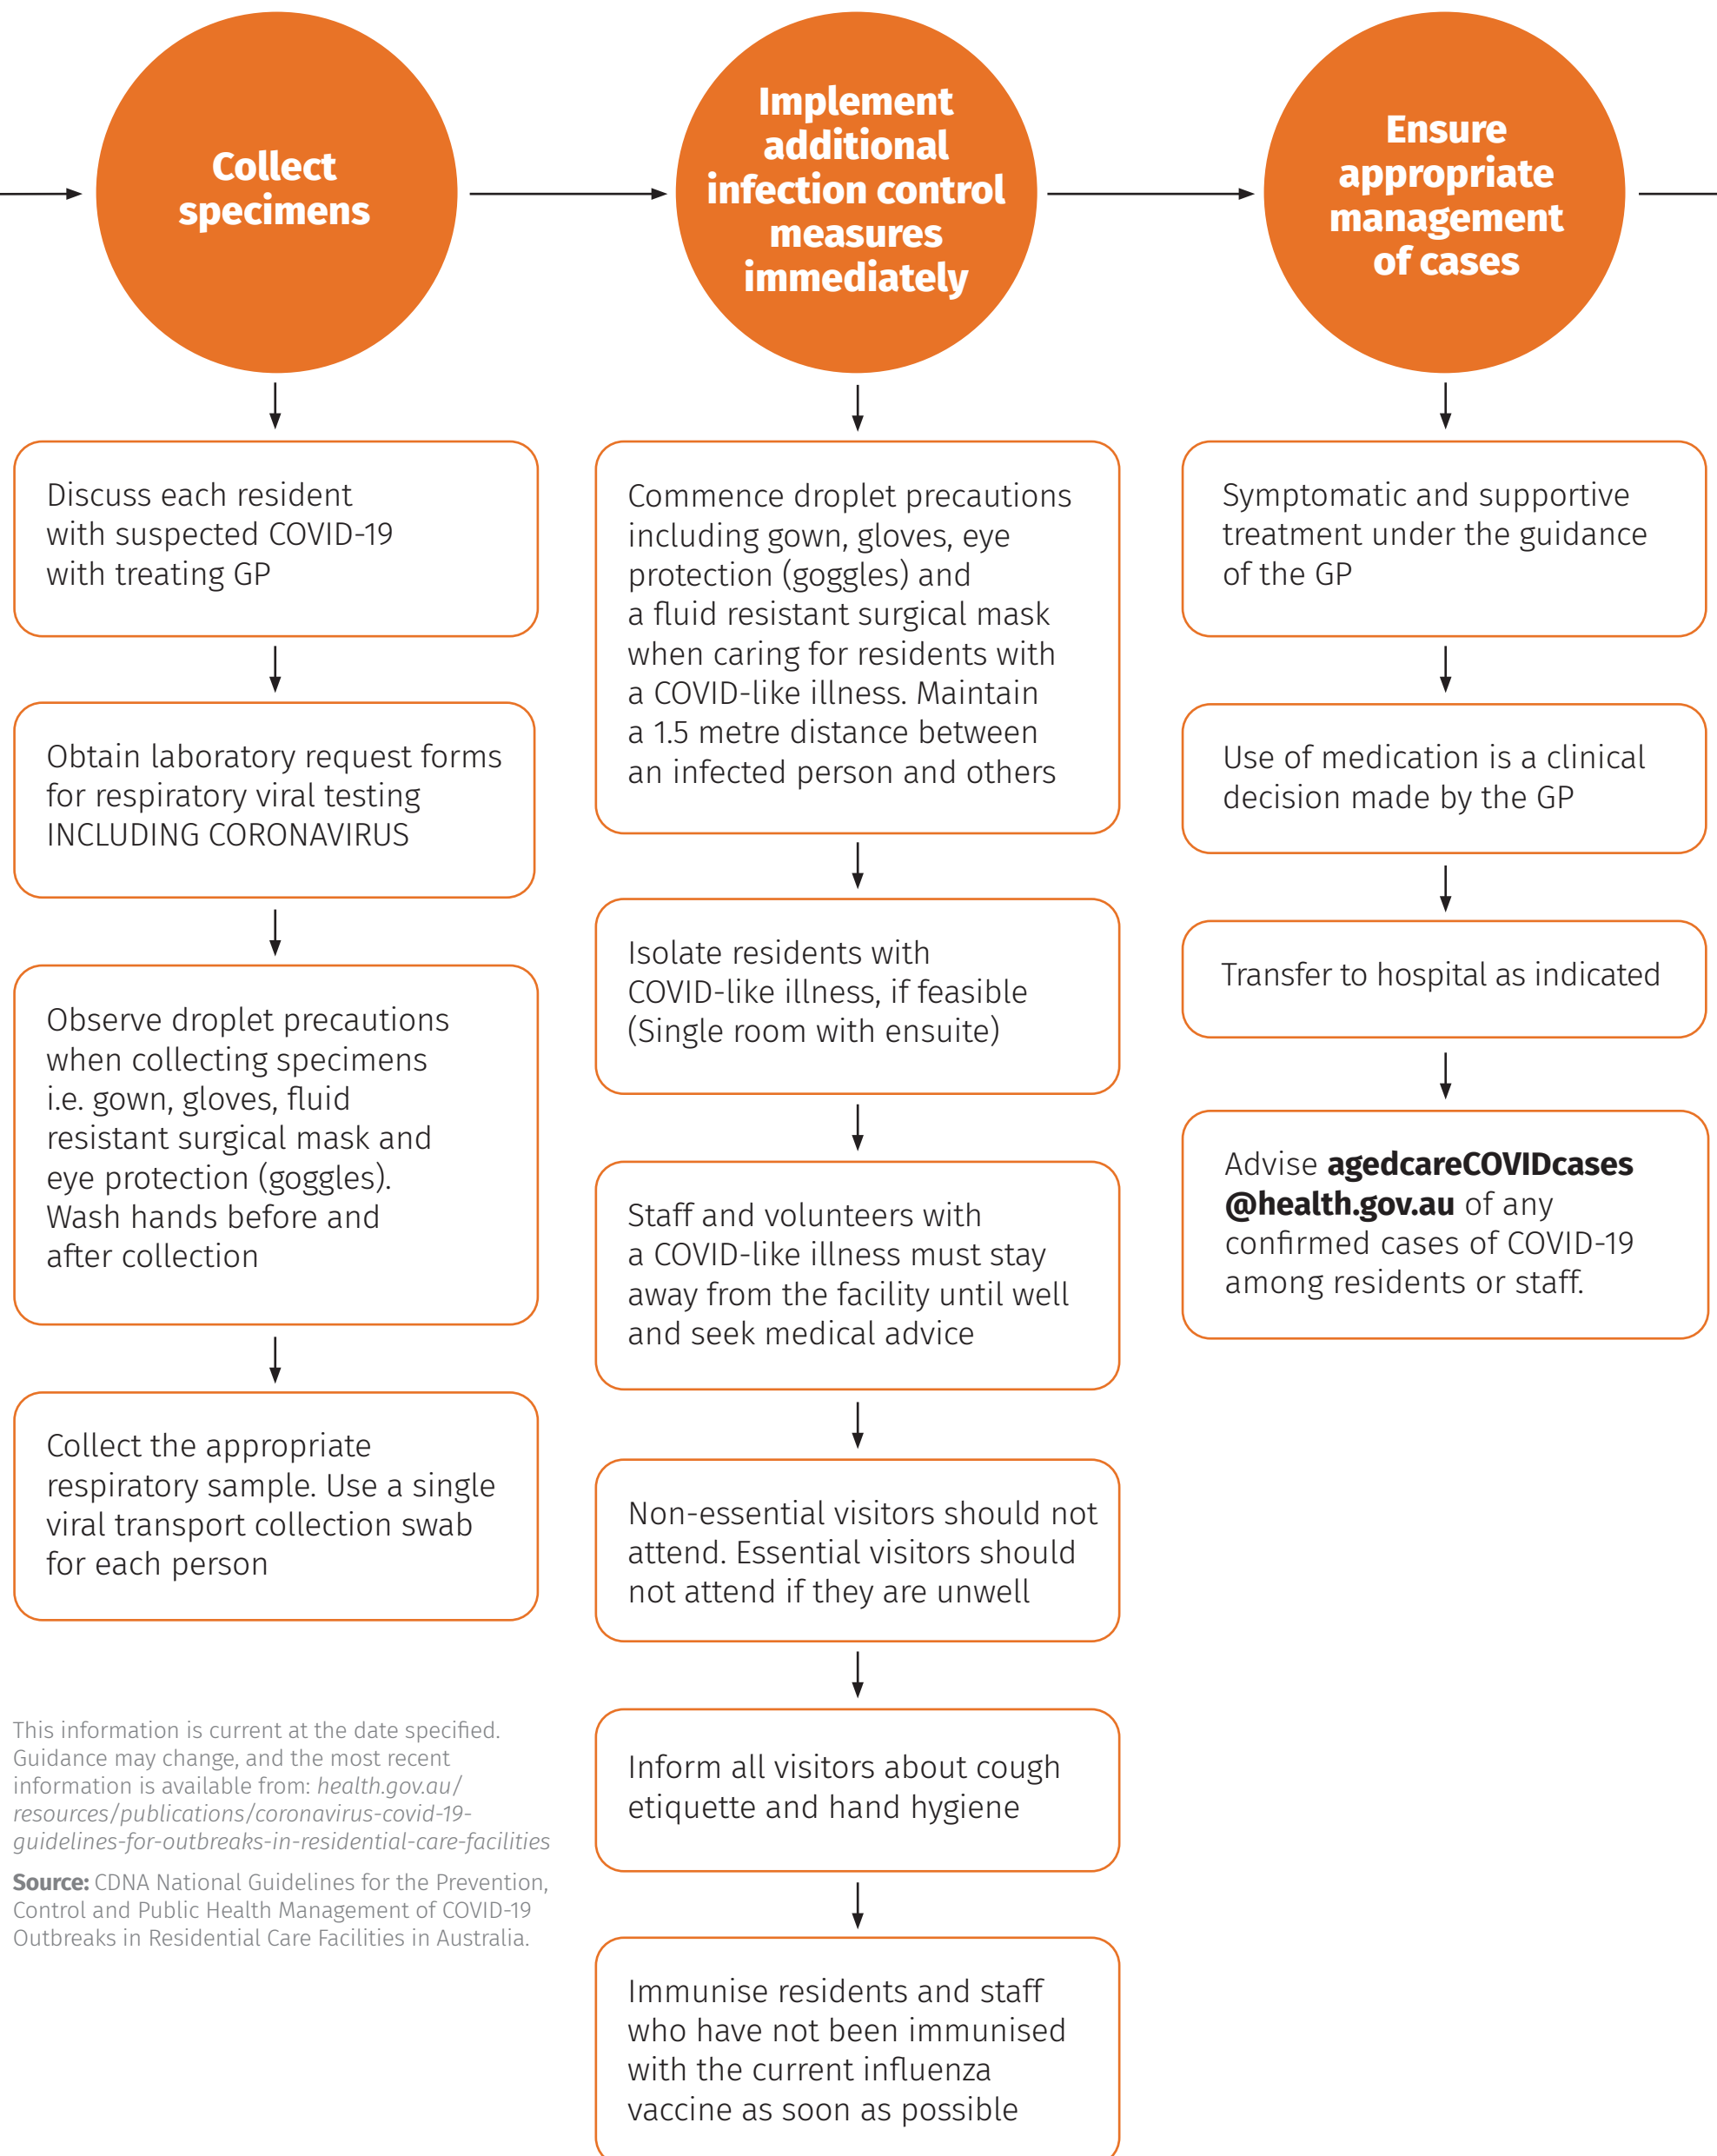

Note: Testing household contacts of confirmed or probable cases of COVID-19 (who have fever ≥38°C or history of fever; e.g. night sweats, chills; OR acute respiratory infection; e.g. cough, shortness of breath, sore throat) may not be indicated where resources are constrained. These cases should be managed as 'probable cases'. Visit: www1.health.gov.au/internet/main/publishing.nsf/Content/cdna-song-novel-coronavirus.htm for further information.
